Contents and evidence

This ZIP supplies constructed rational instances, verification code, exact-solver checks, the accompanying editable manuscript and recorded finite results. Complete universal proofs are in the manuscript. No participant or market data, licensed third-party articles or private review transcripts are included.

Tested installation and replay

A fresh Python 3.10.14 environment on macOS arm64 installed z3-solver 5.0.0.0 and passed all three stages on 17 October 2026. Use requirements-tested.txt. The preserved requirements-smt.txt pin 5.1.0.0 is historical and was not replayed. From a fresh extraction of this ZIP:

```
python3.10 -m venv .venv
.venv/bin/python -m pip install -r requirements-tested.txt
COOPGT_PYTHON="$PWD/.venv/bin/python" bash build.sh --smt
```

Match interpreter patch version 3.10.14 for the recorded setup. The standard-library subset is `bash build.sh`; it does not replace tree/raw-core SMT checks. Scripts regenerate reports: run a disposable copy and retain new results separately. SHA256SUMS.json binds the supplied snapshot.

Coverage and limits

Tree clipping: 120 checks, including 56 strict improvements. Cyclic family: 822,002 full-team inequalities, 33,864 embedding masks, 12 raw-core UNSAT queries and four rejected corruptions. Simultaneous protection: 2,553,912 inequalities, 16 raw-core queries for q=1 through 4, vertices/witnesses through q=8, six cyclic extensions and three rejected corrupt inputs.

All scientific verification code is unchanged from the October14 supplement. The dated manuscript changes bibliographic and title-page presentation only. Finite checks corroborate constructions; they are not exhaustive market coverage, proof-assistant verification, historical priority clearance or human specialist review. Internal proof/diff and model reviews have their recorded limited scopes. Full-original comparisons for Quint1991, Lucas1995 and Stuart1997 remain unresolved.

Source and author gate

With an existing conventional LaTeX installation, `bash build.sh --pdf` builds paper/manuscript.tex. No custom figures/styles or private checkout are needed. Author/contact metadata, declarations and final human responsibility must be completed before journal submission. This is a reviewable preparation package; it has not been submitted.
